

User Guidelines

- Keep the number of bends in the pipeline to a minimum and make it travel straight and vertical as possible to reduce the throttle the pressure of water.
- All the supply lines must have vent pipes to remove air lock and for smooth water flow.
- Use 25mm pipelines rather than 20mm to ensure better water flow and to overcome reductions in dia of pipeline due to scaling inside the pipeline.
- Test the working of all the concealed fitting/flush cock installed on a high pressure for leakage before plastering or fixing the tiles. Faulty product or faulty fitting will result waste of time and money.
- Clean aerators at regular intervals.
- Place the outlet point in the overhead tank at least 25cm above the ground level of the tank. This prevents the flow of foreign particles and sand etc.
- Clean the tank throughly before the supply stars.
- Clean the fitting regularly with normal soap or chalk powder to remove scaling/stains.
- Don't use harsh cleaning agents containing abrasives and acids instead use soft sponge of wet cloth soapy water / diluted vinegar to protect the colour coated finish.
- protect the product from dirt stains and other damages, cover them with cloth/polypack after their installation till they come into actual use.
- Centre to centre distance for hot & cold inlet for all types of wall mounted mixture should be maintained at 165mm in which case any of our wall mixer from different ranges can be easily installed without any problem.
- Look for SPARSH hologram on the product.
- Flush valve and flush cock must be directly connected to overhead tank through 1.5" and 1" water supply lines.
- Concealed or flush cock must be installed with arrow mark in line with the direction of flow of water.
- Geysers should be installed close to the point usage to reduce heat loss.
- For hot and cold water mixers its is advisable to supply the cold water from the over head tank for proper mixing and to prevents scalding.
- Don't use any sharp object to clean the product.
- Strains or black/brown soap on the product: this is result of salt deposit. Clean the product with mild detergent and wipe it with wet cloth regularly to avoid salt deposit. SPARSH bath fitting and shower are made up of brass and these material will never get rusted. If not cleaned and maintained properly the salt and other minerals in the water will deposit on the product and it will be difficult to remove in course of time.
- Always check the product throughly before installing the product. Never use wrench to fit any SPARSH product .If the product is damaged at the time of installation due to mishandling the product can not replaced.
- SPARSH products are sophisticated and luxurious product. Hence proper care must be taken at the time of handling.
- Never hold knob or use pressure on the knob while fitting the taps. This may result in damaging the delicate spindle.
- Water pressure depends on the storage capacity of the tank and height of the tank. The tank must be at least minimum 15 feet high above the tap.
- Apartments above four floors, pressure reducer is recommended.
- Always block the water outflow pipeline before cleaning the over head tank
- Do not use too much of thread or cellar on the thread for fixing the tap. Use teflon tape only.

About Us

Maybe it is because of the accuracy, craftsmanship and meticulous working style which is characteristic of the Black Forest, or because of its passion for water - the elixir of life - that Shri Sanitation developed into an internationally renowned company.

Our passion for the element water continuously motivates us to look for new, progressive solutions.

We see water not simply as just water, but as an elixir of life which is as valuable as it is mysterious, and so we aim to manufacture mixers and shower heads which are as close to perfection as possible. They are designed to make people aware of the value of water, and to stir up their respect for this primeval element. This can only succeed if the products are perfect in form and function, and at the same time create an emotional added value so that water on our skin becomes an experience.

Our innovations must therefore ensure that water can be enjoyed, yet at the same time used in a sustainable way.

Quality assurance

At Shri Sanitation we carry out a multitude of activities to ensure product quality. At various intervals, from the development stage of a product right up to its completion, ready for delivery, the components are systematically subjected to a variety of checks. This ensures that sourced materials meet the demands made of them and perfect products can be delivered to the customer. Our company standards specify requirements with regard to a material or a component.

- We are guided by the needs and requirements of our customers and the users of our products.
- We observe all applicable legal and other provisions; in order to do so, we cooperate with all the relevant authorities in good faith and on a basis of mutual trust.
- We work towards raising the awareness and vigilance of all our employees in their respective areas of responsibility in relation to the importance of matters of health and environmental protection, occupational safety and quality assurance, and of the sustainable use of water and other precious resources. This also includes efforts to motivate our employees to participate actively – especially in the context of continual processes of improvement.
- We subject all our business activities to a risk analysis on a regular basis as a means of proactively detecting and eliminating potential sources of risks; moreover, we investigate all known incidents and near-incidents and analyze their causes in order to detect and eliminate any weaknesses. On this basis, we then develop additional preventive strategies.
- We make available suitable technologies, tools and procedures as well as all the necessary information in order to render the best possible support for the implementation of, and compliance with, these guidelines.
- We cooperate closely with our suppliers and contractors to ensure that their services and work practices meet the requirements arising from these guidelines.
- As part of our EHS management system and our risk management services, we monitor and regularly review compliance with these guidelines with the aim of making further improvements to our health, environmental protection, occupational safety and quality assurance policies. In addition, we commission independent institutions to carry out audits of the efficacy of our management systems and our measures on a regular basis.
